Sato M, Miyaji H, (KYOW) KYOWA HAKKO KOGYO KK Komatsu Y, Yamasaki M; Kuga T, Itoh S,

WPI; 1988-176825/26 P-PSDB; AAP80965 The sequence is carried on plasmid pCSF1-2 isolated from a cDNA library prepared from mRNA extracted from peripheral blood macro- phages. It encodes a protein whose AA sequence agrees with those determined for G-cSF from the human squamous cell line CHU-II and the human bladder cancer cell line 5637. It can be used as a "master gene" for the construction of mutant genes which encode variants of hG-CSF which differ by at least one AA. See also AAN80945 and AAN80946

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         480
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        483
                                                                                                                                                                                                               The invention relates to an Escherichia coli producing and secreting human granulocyte colony stimulating factor (hG-CSF), more specifically, to a recombinant plasmid constructed to express secretory hG-CSF in E. coli, an E. coli transformed with that plasmid to secrete hG-CSF, and a process for preparing hG-CSF using the transformed hG-CSF. The recombinant plasmid vector comprises of a kanamycin resistance gene, a promoter, an endoxylanase signal sequence, a nucleotide sequence coding for an olioopeptide consisting of 13 amino acids including 6 consecutive historian residues and a hG-CSF. E. coli transformed with recombinant plasmid vector is useful for preparing hG-CSF. The method comprises culturing the microorganism to obtain a hG-CSF fusion protein and treating the fusion protein with a protease preferably Factor Xx, to obtain a hG-CSF, where the fusion protein is obtained from the culture by employing Ni-column. The present sequence is human hG-CSF gene inserted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             63
                           human granulocyte colony stimulating factor gene and other components, when transformed into microorganism useful for preparing the colony
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 GTGAGGAAGATCCAGGGCGATGGCGCAGCGCTCCAGGAGAAGCTGTGTGCCACCTACAAG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an Escherichia coli producing and secreting human granulocyte colony stimulating factor (IG-CSF), more specifically, to a recombinant plasmid constructed to express secretory IG-CSF, in E. coli transformed with that plasmid to secrete IG-CSF, and process for preparing IG-CSF using the transformed IG-CSF. The process for preparing IG-CSF using the transformed IG-CSF. The promoter, an endoxylanase signal sequence, a mulleotide sequence coding for an oligopeptide consisting of 13 amino acids including 6 consecutive histidina residues and a IG-CSF. E. coli transformed with recombinant plasmid vector is useful for preparing IG-CSF. The method comprises culturing the microorganism to obtain a IG-CSF fusion protein and treating the fusion protein with a protease preferably Factor Xa, to obtain a IG-CSF, where the fusion protein is obtained from the culture by employing IM-column. The present sequence is human IG-CSF gene inserted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     147

                The plasmid was isolated from a cDNA library prepd. from CHU-2 cells, human oral cavity tumour cell line, using a 1500 bp insert from pBRG4 (AANY0222) and probe LC (AANY1351). The plasmid was used to prepare recombinant expression plasmids for the prodn. of h G-CSF. See also AANY0221-N70224 and AANY1351. (Updated on 25-MAR-2003 to correct PR field.) The cDNA insert of pP12 contains 11 more bases than the CHU-2 G-CSF clone. The major difference between this clone, derived from MIA PaCa-2, and CHU-2 clone is a 9 bp insertion in the CHU-2 clone between bases 237 and 238. There are two other differences: an A at position 588 (G in the CHU-2 clone) is a silent third base change, and a T at position 1237(C in the CHU-2 clone) in the 3' untranslated region.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a cell-free, in vitro method of remodeling a peptide. The method involves removing a saccharyl subunit from the peptide. The method involves removing a saccharyl subunit from the peptide, thus forming a truncated glycan, and contacting the truncated glycan, that least one glycosyl cannot be a peptide. Gulyates can be contacted glycan, thus remodeling the peptide. Gulyates can be contacted between a granulocyte colony stimulating factor (G-CSF) peptide, interferon alpha peptide, interferon beta peptide, Factor VIIa peptide, interferon-gamma peptide, alpha-1-protease inhibitor (A-1-PI) peptide, interferon-gamma peptide, alpha-1-protease inhibitor (A-1-PI) peptide, interferon-gamma peptide, alpha-1-protease inhibitor (TPA) peptide, interferon-gamma peptide, alpha-1-protease inhibitor (TPA) peptide, interfewints. (IL-Z) peptide, Eactor VIII peptide, interfewints a peptide, interfewints a peptide, interfewints a peptide, interfewints (Ig) G fusion peptide, urbainse peptide, anti-CSPS) contibody peptide, anti-respiratory syncytial virus (RSN) F peptide, anti-coppide, interfewints and modifying group, interfewint peptide, interfewints B surface antigen (HbSAg), human growth contact in the method is useful for a modifying group, where the modifying group is covalently attached to the peptide through an intact glycosyl linking group. The method is useful for a cell-free, in vitro method of correspondents
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       t

The examples describe procedures for the designing of probes for hpG-CSF cDNA and genomic clones, both of which are claimed. Specifically claimed are DNA sequences encoding for (Ala 1)hpG-CSF, (Ser 36, 42, 64 and 74)hpG-CSF and the corresponding Met.1 cpds. The novelty is that hpG-CSF is the prod. of procaryotic or eucaryotic expression of an exogenous DNA described in the examples. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        97 GTGAGGAAGATCCAGGGCGATGGCGCAGCGCTCCAGGAGAAGCTGTGTGCCACCTACAAG

                                               The present invention describes a recombinant microorganism expressing a granulocyte colony stimulating factor (G-CSF), and process for preparing the recombinant protein. The present sequence encodes a G-CSF related protein, which is given in the exemplification of the present invention
                                                                                                                                                                                                                                                  9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention relates to a combination comprising several cDNAs that are differentially expressed in activated vascular tissue. The invention also discloses a high throughput method for detecting differentially expressed complaints in a sample. The cDNAs of the invention may have compared to the cDNAs of the invention may have antidiabetic; gradecological, vasortopic and cerebroptorective activities and may be used in gene therapy. The CDNAs of the invention may be used in a mample, or screening several molecules or compounds to the invention of one or more confounds to a sample, or screening several molecules or compounds to identify a molecule or compound that specifically binds a CDNA of the invention. A protein encoded by the CDNA may be used to screen several confourable or compounds to identify a ligand that specifically binds to the protein, or to produce or purify an antibody to the protein that can be used to detect a protein in a sample. The nucleotides may be useful for cerecombinant protein from a sample. The nucleotides may be useful for diagnosing, staging, treating, or monitoring the progression of treatment of a vascular disease, e.g. atherosclerosis, cancer, coronary artery disease, hypertension, diabetes, pre-eclampsia, ischaemia- reperfusion injury, restenosis, or stroke. The CDNAs can also be used for large-scale conjugated with abnormalities in the expression, amount or distribution of the protein. The present sequence represents a cDNA of the invention of the protein. The present sequence represents a cDNA of the invention chart is differentially expressed in activated vascular tissue. Note: The sequence data for this patent directly from USPTO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               576
                                                                                                                                             The invention relates to a method for producing recombinant human granulocyte colony stimulating factor (rhGCSP). The method includes the following steps: (a) reverse transcription-polymerase chain reaction of the human granulocyte colony stimulating factor gene; (b) transforming bechericals coli; (c) renaturation of protein by hollow fibre ultrafiltration dialysis; (d) passing the renatured protein through ion exchange chromatography, hydrophobic chromatography and molecular sieve purifying so to obtain a high yield of high-purity medicinal rhG-GSF protein. The present sequence encodes rhG-GSF
                                                                                                                                                                                                                                                                                                                                                                                                               9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CTGTGCCACCCCGAGGAGCTGGTGCTGCTCGGACACTCTCTGGGCATCCCCTGGGCTCCC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence encodes a recombinant human granulocyte colony stimulating factor (rhG-CSF). The present invention describes rhG-CSF proteins which are obtained by adding 3-6 amino acid residues at the N-terminal of the hG-CSF sequence, in which at least one amino acid residue is arginine. Preferably adding 4-6 amino acid residues including the sequence of methionine, arginine, glutamic acid and serine at the N-terminal. Also described are the related sequence, expression carrier, host cell and medicinal composition. The activity of the recombinant protein is increased and its stability is increased
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  135

G-CSF stimulates proliferation of specific bone marrow precursor cells and their differentiation into granulocytes. The gene incorporates useful mutagenesis of selected regions. See also AAP91070. ```

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
